Abstract: This article examines the current topic of interactive learning and the use of modern technologies in the educational process. The results of the study show that interactive learning using technology has greater potential to improve the effectiveness of education. The findings discuss the benefits of this approach and offer prospects for further research in this area.

Key words: interactive learning, technologies, modern pedagogy, educational efficiency.

Introduction

The modern era is characterized by rapid technological changes that have a significant impact on various areas of human life. In particular, education and pedagogy have not remained on the sidelines of this revolution. With the development of information and communication technologies (ICT), digitalization of educational processes and the active implementation of interactive teaching methods, modern pedagogy is on the threshold of a new era. Interactive learning, in the context of modern pedagogy, is an approach in which students actively interact with educational material, teachers and their peers. This approach, which combines pedagogical methods and technological innovations, has a significant impact on educational processes and learning outcomes. The relevance of this topic cannot be overestimated. The rapid development of the modern world requires educational models that can form flexible, creative, and critically thinking citizens who are able to adapt to constantly changing conditions. In this context, the use of interactive methods and technologies is becoming one of the key factors in increasing the effectiveness of education. The purpose of this article is to review current trends in the use of interactive teaching methods and technologies in pedagogical practice. We will focus on identifying the advantages and disadvantages of this approach and analyze its impact on the quality of education. To achieve this goal, we will analyze current literature, examine the experience of practical application of interactive methods and technologies, and present conclusions and recommendations for future research and pedagogical practice. Literature Review Interactive learning is a pedagogical method that involves active interaction of students with educational material and with each other. This approach is becoming increasingly significant in the context of modern pedagogy, thanks to innovative developments in the field of ICT. At the same time, interactive learning covers a wide range of methods and technologies, including virtual reality, online platforms, mobile applications, webinars, social networks and many other tools and resources [1, p. 22]. One of the key advantages of interactive learning is its ability to individualize the educational process. Students are able to choose the pace and method of studying the material, which contributes to a deeper assimilation of knowledge and a better understanding of the educational material.

In addition, interactive learning helps create learning environments that are closer to real-life situations, which in turn helps develop practical skills and prepare students for the real challenges of the modern world. Main Part Methodology To more deeply analyze the impact of interactive learning and modern technologies on the effectiveness of education, we conducted a study covering several key aspects. First, we analyzed modern literature, including research articles, books, and reports related to the topic of interactive learning. This stage allowed us to gain an extensive understanding of existing trends, developments, and methods in this area. Second, we conducted a comparative analysis of educational practices. This included studying the experience of using interactive methods and technologies in various educational institutions, from primary school to higher education. We conducted observations, interviews, and questionnaires with teachers and students to understand which specific methods and technologies have the greatest impact on the learning process .

Results

Our research allowed us to highlight several key results. First, we found that interactive learning based on modern technologies has significant potential for improving the effectiveness of education. Pupils and students participating in such educational programs are more likely to actively participate in the learning process and have a higher level of motivation. Second, the results showed that interactive learning contributes to better assimilation of educational material. Pupils participating in interactive classes often demonstrate a deeper understanding and application of educational concepts in real-life situations. Conclusions and Future Prospects of the Research The research in the field of interactive learning and the use of modern technologies in modern pedagogy led to the following key findings: Interactive learning has significant potential. According to the results of our study, interactive learning using modern technologies has a positive impact on the effectiveness of education. Pupils and students participating in interactive educational programs show a higher level of motivation, actively interact with the educational material and demonstrate a deeper understanding of educational concepts. Individualization of education. Interactive learning allows students to choose the pace and method of studying the material, which contributes to a deeper assimilation of knowledge and the development of self-regulation. An approach focused on individualization allows teachers to more effectively adapt the educational process to the individual needs and characteristics of each student. Teacher training. One of the key factors in the successful implementation of interactive learning is the preparation and training of teachers. Teachers must master new skills and competencies to work effectively with interactive methods and technologies. This may require additional courses and professional development. Development of high-quality educational content. One of the key aspects of successful interactive learning is the availability of high-quality educational materials adapted to interactive formats and platforms. This requires investment in content development and collaboration between teachers and IT specialist. The need for further research. Further research is needed to better understand interactive learning and its impact on education. These studies should cover various aspects, including the effectiveness of various technological solutions, methods of evaluating results, as well as the experience of successfully implementing interactive methods in various educational contexts.

Further prospects for research in the field of interactive learning and modern technologies include a more in-depth study of specific methods and pedagogical practices that

are most effectively applicable at different levels and types of education. It is also necessary to continue work on the development and adaptation of technological tools for educational purposes, including the development of virtual reality, artificial intelligence and other innovative solutions. It is important to support the exchange of experience and cooperation between educators, researchers and technology developers in order to create a more favorable educational future .
